

## Total Recorder Audio Recording Software

Total Recorder is a sound recording, processing, and playing program. It records analog sound digitized by a sound card, as well as sound generated, or requested, by other computer programs, such as RealPlayer, Windows Media Player, Quick Time, WinAmp, and many others. Recorded sound is saved in wave-file format, MP3 or Windows Media Audio format.

Total recorder's easy to use controls, allow users to view and adjust the level of their recording. When finished the user can edit the recording using the waveform graph on the bottom half of the screen. You can cut, copy, paste or delete any portion of the audio. This is particularly useful to remove blank space at the beginning or end of a recording.

With the addition of a high quality microphone, Total Recorder can be used to record broadcast quality audio programs for use on radio. The Plantronics DSP-500 digitally-enhanced Multimedia Headset features a noise-canceling microphone and inline digital volume and mute controls.

Agents can record their weekly radio program, save it as an mp3 and email it to the local radio station or copy it to CD. Programs can be archived for use or reuse at a later date.

### Product Features:

- Digital Signal Processor for digitally-enhanced stereo sound
- 40mm speakers provide greater bass response
- Digital Signal Processor provides full-range digital audio
- PerSono Audio Control Software for easy control
- QuickAdjust microphone boom
- New lightweight materials for ultimate comfort
- USB Connection for desktop or notebook
